

Department of Conservation Statement of Service Performance (Output) Reporting detail of Species Management for the year ended 30 June 2015.

The information provided below lists New Zealand native species that are classified in some way as threatened, and which had targets to proceed with work in the year 2014-15 (either active species management programmes or survey monitoring and research), with the intention of improving their security or improving our understanding of status and threats. The reasons why a small number of species did not have planned work undertaken is explained as notes below. The species listed here are the subject of work that is additional to the work on 159 species that are under active management through optimised species prescriptions, but may well be the same species, just managed at different location. Species listed below are thus receiving additional management support to that provided through the normal priority work programmes.

The most recent available threat classification is included in the column to the right of the table. All groups are now assessed using the Townsend et al. (2008) criteria. The species that appear in these lists will change over time for various reasons; from understanding the consequence of management actions, from further assessment of species status, from benefiting from the management of ecosystems where they occur (as part of managing priority ecosystems for ecological integrity), and from choices made on priorities for species to work on in any given year.

Information on the New Zealand threat classification system can be found on the DOC website <http://www.doc.govt.nz/publications/conservation/nz-threat-classification-system/>

(1) Time taken in dealing with staff replacement and capacity building led to this monitoring not proceeding.

(2) Staff time was re-prioritised on to the Battle for Our Birds programme this year.

(3) Staff time was re-directed to island biosecurity surveillance monitoring on Maud Island following a rodent incursion.

(4) The population of this hibiscus species on the Cavalli Islands cannot currently be researched due to access restrictions set by the owners. The last remote monitoring effort did not detect the presence of the plant, and its current status is yet to be determined.

(5) Staff time was re-prioritised on to the Battle for Our Birds programme this year.

(6) This plant species has recently been assessed as being more common than previously thought, and not a priority for targeted management

(7) There was no-one available with the technical skills required to undertake the research into this plant.

(8) Time taken in dealing with staff replacement and capacity building led to this monitoring not proceeding.

(9) Reporting the intention to undertake work on this beetle was an error during business planning.

(10) As result of injury the person with the technical skills was not available to undertake the research into this gecko .

(11) This galaxid is no longer at risk at the site where work was planned, so no further work was required this year.

(12) A population of little spotted kiwi on Chalky Island has been established through translocation, and the scheduled monitoring will start next year, rather than during this year. The target of commencing monitoring this year was incorrect, as time is needed for numbers to build.

(13) The survey work for this bat did not proceed due to unsuitable weather conditions, and staff were not available for rescheduling the work.
