

**Conservation Services Programme
Observer Report for the period 1 July 2004 until
30 June 2007**

FINAL DRAFT October 2008

**Stephanie Rowe
Marine Conservation Services
Department of Conservation
2008**

Abstract

The Department of Conservation, through the Conservation Services Programme, has a statutory role to carry out Conservation Services which include monitoring and data collection related to protected species interactions with fisheries. In order to fulfil this role, Government observers are placed on commercial fishing vessels operating in New Zealand's Exclusive Economic Zone to monitor interactions with protected species.

Protected species known to interact with commercial fishing operations include seabirds, marine mammals and marine turtles. Protected corals are landed in some fisheries. The information collected by observers can identify where the most significant interactions are occurring and can inform development and application of strategies to minimise adverse effects.

This report details protected species captures by fishery, method and area for three observer years (2004/05, 2005/06 and 2006/07) in relation to observer effort and commercial fishing effort. Information is presented at a coarse level to inform where fishing effort, observer coverage and captures occur so that potential gaps in monitoring can be identified along with high risk areas and time periods in various fisheries.

Introduction

Understanding the nature and extent of interactions between commercial fisheries and protected species is the foundation of the Conservation Services Programme. The Programme also works to develop effective solutions to mitigate adverse effects of commercial fishing on protected species in NZ fisheries waters.

Government observers are placed on commercial fishing vessels operating in New Zealand's Exclusive Economic Zone in order to monitor interactions with protected species. This information can identify where the most significant interactions are occurring and can inform development and application of strategies to minimise adverse effects. Such data contribute to assessments of whether protected species mortality is sustainable and whether mitigation strategies employed by fishing fleets are effective at reducing protected species captures.

The specific objectives of the project are currently:

1. To identify, describe and, where possible, quantify protected species interactions with commercial fisheries;
2. To identify, describe and, where possible, quantify measures for mitigating protected species interactions;
3. To collect other relevant information on protected species interactions that will assist in assessing, developing and improving mitigation measures.

In recent years protected species interactions with some fisheries have become well understood, although sometimes rarely quantified, while interactions with other fisheries are less well understood, especially inshore fisheries. For example, trends in seabird bycatch in parts of the hoki fishery and squid fishery are relatively clear, and our understanding of those interactions well developed. In contrast, in inshore areas, efforts to determine the nature of interactions are still required, and robust estimates of the extent are not yet broadly possible.

Progress with mitigating known interactions are at various stages in different fisheries depending on both the degree to which interactions are understood and the ability to find practical and cost effective solutions to those interactions. For example, seabird warp captures on trawlers have shown to be reduced through various bird scaring devices (Middleton and Abraham, 2007) and offal management (Abraham *et al.*, 2008). Addressing dolphin bycatch in pelagic trawl fisheries, in contrast, is less clear to solve and currently no mitigation techniques are in place. Mitigation methods have been introduced through regulations into several fisheries including trawlers over 28 m in length (requirement to use seabird scaring devices) and surface longline vessels (requirement to night set and use streamer lines). In other fisheries, mitigation techniques or fishing practices are being investigated and / or developed (e.g. offal management, line weighting). For inshore fisheries, particularly setnet and trawl, little is currently known from the observer programme about fishing practices due to limited coverage. This makes it more difficult to assess the need or potential for mitigation measures to be developed and implemented.

This report details protected species captures by fishery, method and area for three observer years (2004/05, 2005/06 and 2006/07) in relation to observer effort and commercial fishing effort. Information is presented at a coarse level to inform where fishing effort, observer coverage and captures occur so that potential gaps in monitoring can be identified along with high risk areas and time periods in various fisheries. More analytical assessments of protected species bycatch are undertaken through other projects¹.

All data used in this report has been provided by the Ministry of Fisheries Research Data Management team. Observer diaries and reports are also used to provide information on mitigation, general observations and fishing practices.

Data collection

To date, the bulk of publicly available information on at-sea interactions between fishing vessels and protected species in New Zealand waters has been collected by Government observers.

The duties of an observer in respect of the Conservation Services Programme can be summarised as:

- Monitoring and recording the interactions of protected species with fishing operations
- Reporting on the efforts made to mitigate the adverse effects of commercial fishing on protected species
- Recording, photographing, tagging all protected species bycatch
- Recovering and retaining specimens for autopsy and / or identification
- Recording at least on a daily basis the numbers, and the behaviour of, marine mammal and seabird species seen around the fishing vessel
- Carrying out other tasks (e.g. making observations on discard and offal discharge) as required.

It is important to note that observer programmes typically have high spatial and temporal variation, as well as multiple priorities for information collection, which can make the data challenging to interpret and extrapolate to get actual bycatch rates by fishery, location, or other desired variables. Data accuracy and relevance can be affected by inter-observer variability, weather conditions and access to vessels, while precision is affected by the observer sampling design. Data quality may also be biased by the opportunistic allocation of observers to vessels, as it is not always possible to place observers on vessels randomly. Nevertheless, the use of fisheries observers is currently considered to be the most reliable and flexible means of acquiring data on protected species interactions.

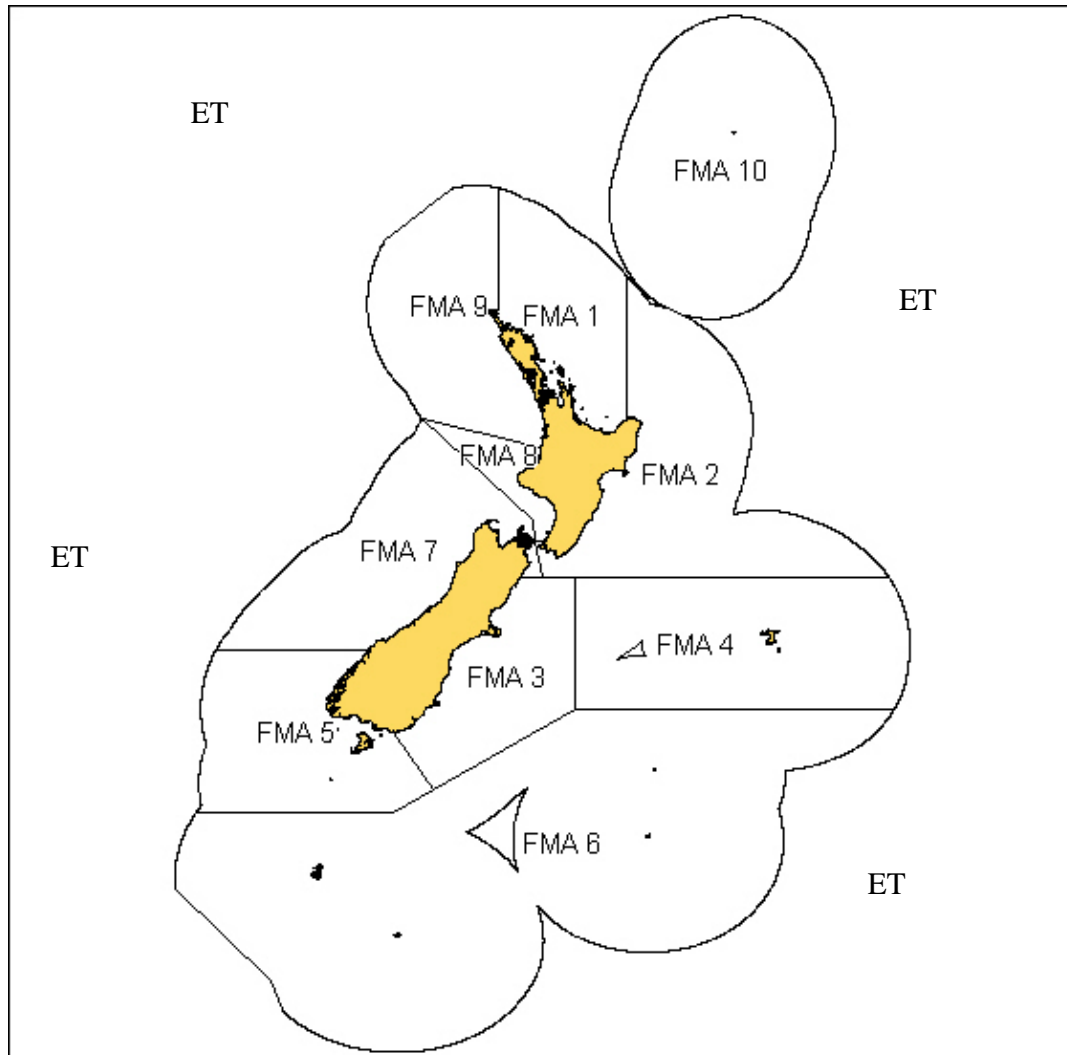

¹ Projects include estimation of total protected species captures, risk assessments, species prioritisation and other modelling projects undertaken by the Department of Conservation or Ministry of Fisheries.

Format

The remainder of this document is divided into separate ‘fisheries’ where certain target species are grouped according to fishing method. For each ‘fishery’ an overall summary of commercial effort, observer effort and protected species bycatch is provided by Fisheries Management Area (see Fig 1). Note that the word ‘captures’ in this report refers to captures reported by government observers. Protected species captures and observer effort are then broken down further for each target stock by area and month in order to view captures and observer effort temporally and spatially. Data is divided into the three observer years which run 1 July to 30 June the following year. A summary of protected species (excluding corals) interactions by observer year and by Fisheries Management Area (FMA) and year are provided in Appendices 1 and 2, respectively. Common names for protected species and fish species are used throughout this report. Scientific names of protected species mentioned in this report are provided in Appendix 3. Reported coral² catches are presented by and fishery and year in Appendix 4, and by FMA and year in Appendix 5.

² The group of organisms collectively known as ‘black corals’, (Cnidaria, Antipatharia) are currently protected under the Wildlife Act 1953. ‘Red corals’ are also listed as protected under the Wildlife Act 1953. The definition of ‘red corals’ is currently being clarified through the revision of Schedule 7A of the Wildlife Act and the definition may be extended to other species or groups, including bubblegum coral and precious corals.

Protected species interactions

MIDDLE DEPTH TRAWL FISHERIES

Hoki, hake, silver warehou and ling

For protected species interactions, the method, location and timing of fishing are all of high importance, with the mix of target species being of less importance. As such, protected species observer coverage of tows targeting the middle depth trawl stocks hoki, hake, ling or silver warehou are discussed together. While additional stocks may be targeted through the method of middle depth trawl, these four stocks have the greatest targeted effort and higher number of protected species interactions relative to other target species.

Coverage in this middle depth trawl fishery can be split into the 'hoki season' and 'out of season' hoki fisheries, which operate during different months and fisheries areas. The 'hoki season' is focused on the west coast of the South Island (CHA) and the Cook Strait (CEE, CHA), where both hoki and hake are predominantly targeted from June to September. The 'out of season' hoki fishery operates from September until June when hoki, hake and silver warehou are targeted, mostly in SOE and SUB, with some coverage in SEC and SOU.

Mitigation techniques employed in this 'fishery' include offal and discard management, and the use of bird scaring devices. Trawl vessels over 28 m in length are required to use paired streamer (tori) lines, bird bafflers or warp deflectors (scarers). Based on observer reports, most vessels use tori lines and few vessels use bird bafflers or warp scarers. At present, no mitigation devices are in place to reduce pinniped captures although fishing practices such as not setting while marine mammals are present around the vessel are practiced by some vessels. The potential to use Seal Exclusion Devices in this fishery is currently being investigated (CSP MIT 2006/09). Research into seabird net captures is also underway (CSP MIT 2006/02) and offal management research (started under MIT2004/01, and currently supported with Crown funding) is ongoing.

Seabird captures were highest numerically in 2005/06 and reduced in 2006/07. In 2004/05 and 2005/06, the highest rate of seabird captures per observer tow was in SEC. Higher captures of sooty shearwaters in trawl nets were reported in 2005/06 compared to other years. Fur seal captures were highest in 2005/06.

Seabird and marine mammal captures per observer year are detailed in Tables 1 and 2.

Table 1: Seabird captures in middle depth trawl fisheries (HAK, HOK, LIN, SWA) over three observer years

| Species | 2004/05 | | 2005/06 | | 2006/07 | |

| White-chinned petrel | 3 | 0 | 4 | 1 | 3 | 0 |
| Total | 40 | 92 | 123 | 31 | 23 | 14 |

Table 2: Marine mammal captures in middle depth trawl fisheries (HAK, HOK, LIN, SWA) over three observer years

| Species | 2004/05 | | 2005/06 | | 2006/07 | |
|----------|---------|-------|---------|-------|---------|-------|
| | Dead | Alive | Dead | Alive | Dead | Alive |
| Fur seal | 54 | 9 | 101 | 11 | 74 | 13 |
| Total | 54 | 9 | 101 | 11 | 74 | 13 |

Seabird and fur seal captures by target species are given in Tables 3 and 4. While the majority of seabirds are caught on tows targeting hoki, a large number of birds was caught on tows targeting silver warehou in 2005/06. These birds were mostly sooty shearwaters and 16 were albatrosses. Captures were reported across three trips, one of which caught 35 seabirds. Fur seal captures were also higher on tows targeting hoki (Table 4). However, from Table 5 it can be seen that a greater number of hoki tows are observed (Table 5).

Table 3: Seabird captures by target species for each observer year

| | 2004/05 | | 2005/06 | | 2006/07 | |

| Total | 2857 | 2443 | 2653 |

2004/05

Middle depth trawl effort in the 2004/05 observer year was spread throughout almost all FMAs with the least effort on the west coast of the upper North Island and no effort in the Kermadec region (Table 6). During this observer year, most coverage in terms of days was in CHA as well as SEC and SOE. The percentage of commercial fishing days observed was fairly even through most FMAs observed with the highest coverage in CHA. Overall, less than 15% of total effort was observed. The highest rates of seabird captures occurred in SEC and SOE while the highest rates of marine mammal captures occurred in SEC, SOU and SUB.

Table 6: Summary of commercial effort, observer effort and protected species captures in middle depth trawl fisheries (HAK, HOK, LIN, SWA) for the period 1 July 2004 – 30 June 2005.

| FMA | Effort days | Observer days | % coverage | No. tows observed | Seabird captures | Seabirds per 100 tows | Mammal captures | Mammals per 100 tows |
|---------|-------------|---------------|------------|-------------------|------------------|-----------------------|-----------------|----------------------|
| 1. AKE | 108 | | | | | | | |
| 2. CEE | 951 | 14 | 1.5% | 124 | | 0.00 | 1 | 0.81 |
| 3. SEC | 2668 | 286 | 10.7% | 570 | 59 | 10.35 | 26 | 4.56 |
| 4. SOE | 1614 | 241 | 14.9% | 489 | 32 | 6.54 | | 0.00 |
| 5. SOU | 445 | 46 | 10.3% | 95 | 1 | 1.05 | 3 | 3.16 |

| 8. CEW | 2 | | | | | | | |
| 9. AKW | 1 | 1 | 100% | 1 | | 0.00 | | 0.00 |
| 10. KER | | | | | | | | |
| Total | 9160 | 1245 | 13.6% | 2857 | 132 | 4.62 | 64 | 2.24 |

Observer coverage in middle depth trawl fisheries was spread through the year with most effort in SEC and CHA from July to September (Table 7). Coverage through the rest of the year was mainly in SEC, SOE and SOU. Observer coverage follows fishing effort of vessels operating in this fishery throughout the year.

Table 7: Observer days in middle depth trawl fisheries (HAK, HOK, LIN, SWA) by area and month for the period 1 July 2004 – 30 June 2005.

| FMA | Jul-04 | Aug-04 | Sep-04 | Oct-04 | Nov-04 | Dec-04 | Jan-05 | Feb-05 | Mar-05 | Apr-05 | May-05 | Jun-05 | Total |

| Total | 6 | 30 | 12 | 8 | 2 | 6 | 64 |

2005/06

Commercial effort in terms of fishing days was reduced in 2005/06 compared to the 2004/05 observer year with a reduction in observer effort also (Table 10). The spread of commercial fishing effort was similar to 2004/05 with reductions in all areas, especially in CEE, SOE and SUB. The spread of observer effort was somewhat different with higher levels of coverage in SOU and SUB. As in 2004/05, the highest rate of seabird interactions occurred in SEC, followed by CEE and SOU. The highest rate of marine mammal captures were recorded in CEE, while the highest number of marine mammal captures were reported in CHA.

Table 10: Summary of commercial effort, observer effort and protected species captures in middle depth trawl fisheries (HAK, HOK, LIN, SWA) for the period 1 July 2005 – 30 June 2006.

| | Effort days | Observer days | % coverage | No. tows observed | Seabird captures | Seabirds per 100 tows | Mammal captures | Mammals per 100 tows |
|---------|-------------|---------------|------------|-------------------|------------------|-----------------------|-----------------|----------------------|

Seabird captures were reported throughout the year with higher numbers recorded in March and May, mostly in SEC (Table 12). One observed trip targeting SWA and HOK incidentally

killed over 50 sooty shearwaters, mostly in May, as well as several other seabird species and marine mammals. Several other trips also reported multiple captures.

Table 12: Seabird captures in middle depth trawl fisheries (HAK, HOK, LIN, SWA) by area and month for the period 1 July 2005 – 30 June 2006.

| FMA | Jul-05 | Aug-05 | Sep-05 | Oct-05 | Nov-05 | Feb-06 | Mar-06 | Apr-06 | May-06 | Jun-06 | Total |

| Total | 4 | 18 | 11 | 8 | 1 | 3 | 45 | 2 | 60 | 2 | 154 |

Fur seal captures were highest from July to September, mostly in FMAs CEE and CHA (Table 13). Fewer captures were recorded outside these months. One trip observed in CEE caught 18 fur seals. Fur seal captures in CHA were reported across 12 trips with captures ranging from one individual per trip through to 18 per trip.

Table 13: Fur seal captures in middle depth trawl fisheries (HAK, HOK, LIN, SWA) by area and month for the period 1 July 2005 – 30 June 2006.

2006/07

Commercial effort in 2006/07 was similar to the previous two observer years (Table 14). Observer coverage was more evenly spread to provide around 20% coverage in four FMAs. Seabird and marine mammal interactions were reduced compared to previous years, most notably marine mammal captures in CHA.

Table 14: Summary of commercial effort, observer effort and protected species captures in middle depth trawl fisheries (HAK, HOK, LIN, SWA) for the period 1 July 2006 – 30 June 2007.

| FMA | Effort days | Observer days | % coverage | No. tows | Seabird captures | Seabirds per 100 tows | Mammal captures | Mammals per 100 tows |

Southern Blue Whiting

The southern blue whiting fishery operates in specific areas (SOI and SUB) during August and September. Over the past three observer years, observer coverage has been planned to cover 30% of fishing effort.

Fur seals and sea lions have been incidentally caught in this fishery and seabird interactions tend to be lower than in other trawl fisheries. Coral has been landed in this fishery (see Appendices 4 and 5). Vessels over 28 m in length are required to use seabird mitigation devices. Sea lion exclusion devices are not used in this fishery. Vessels also employ offal and discard management techniques that aim to reduce seabird interactions.

Seabird and marine mammal captures per observer year are detailed in Table 18.

Table 18: Protected species captures in the southern blue whiting fishery over three observer years

| Species | 2004/05 | | 2005/06 | | 2006/07 | |
|--------------------------|---------|-------|---------|-------|---------|-------|

| Total | 24 | 9 | 33 |

2006/07

In 2006/07, commercial effort was decreased compared to previous years, as was the number of observer days (Table 25). Observer coverage as a percentage of effort was similar to 2005/06. While seabird captures remained low, marine mammal captures increased again from the previous two observer years.

Table 25: Summary of commercial effort, observer effort and protected species captures in the southern blue whiting fishery for the period 1 July 2006 – 30 June 2007.

| FMA | Effort days | Observer days | % coverage | No. tows | Seabird captures | Seabirds per 100 tows | Mammal captures | Mammals per 100 tows |

| 10. KER | | | | | | | | |
| Total | 296 | 108 | 36.5% | 227 | 4 | 1.76 | 55 | 24.23 |

Observer coverage was spread over the three month fishing season with greatest effort still in August and September and few days in October (Table 26).

Table 26: Observer days in the southern blue whiting fishery by area and month for the period 1 July 2006 – 30 June 2007.

| FMA | Aug-06 | Sep-06 | Oct-06 | Total |
|--------|--------|--------|--------|-------|
| 6. SUB | 30 | 69 | 6 | 108 |
| Total | 31 | 71 | 6 | 108 |

All seabird captures were reported in August whereas all NZ sea lions were reported in September. Fifty one of the 52 fur seal captures were reported in August. A few vessels operating in this fishery have contributed to the majority of capture events, particularly for fur seals. One observed trip reported the capture of 24 fur seals and three NZ sea lions, another reported 16 fur seal captures and 12 fur seals were reported caught from another trip.

Scampi

CSP observer coverage in the scampi fishery has been mostly in SOE from July to December and SUB (SOI) from January to April, with lesser coverage in AKE and CEE. Observations are undertaken to monitor interactions with seabirds and NZ sea lions. Interactions with seabirds have been recorded in this fishery as well as occasional interactions with sea lions in the southern scampi fishery. Coral has occasionally been landed in this fishery (see Appendices 4 & 5).

Mitigation techniques employed in this fishery include offal and discard retention and the use of bird scaring devices (required for vessels over 28 m). While many scampi vessels are less than 28 m in length, most use seabird mitigation devices of some sort including tori lines and home-made warp scarers.

Seabird and marine mammal captures per observer year are detailed in Table 27.

Table 27: Protected species captures in the scampi trawl fisheries over three observer years

2004/05

The majority of scampi fishing effort was in AKE, CEE, SOE and SUB (Table 28). In 2004/05, no observer effort was achieved in SUB and minimal observer effort was achieved in AKE, CEE and SOE. Despite the low levels of observer effort, seabird capture rates were relatively high compared to other trawl fisheries.

Table 28: Summary of commercial effort, observer effort and protected species captures in the scampi trawl fishery for the period 1 July 2004 – 30 June 2005.

| FMA | Effort days | Observer days | % coverage | No. tows | Seabird captures | Seabirds per 100 tows | Mammal captures | Mammals per 100 tows |

Squid

Higher levels of observer coverage have been planned and delivered in this fishery compared to other trawl fisheries due to historically high levels of seabird bycatch, especially white-capped albatross warp captures and net captures of sooty shearwaters and white-chinned petrels. Offal has been identified as a key issue leading to warp captures in this fishery (Abraham and Middleton 2007) and practices are currently being developed to manage discharging waste during active fishing. Research is also underway to investigate the factors that lead to net captures and possible mitigation techniques (CSP MIT 2006/02). In addition, the Deepwater Group Ltd has developed voluntary Vessel Management Plans for deepwater factory trawlers which outline the offal and discard management measures and mitigation devices or practices employed by each vessel. This fishery is also a focus of observer coverage due to captures of NZ sea lions. Vessels operating in the squid 6T fishery area use sea lion exclusion devices. Observer coverage in the squid fishery has been focussed in the 6T fishery in the Subantarctic FMA with additional coverage in SOU, usually achieved as vessels are travelling to 6T.

Seabird and marine mammal captures per observer year are detailed in Tables 37 and 38. Seabird captures have decreased over the three year period.

Table 37: Seabird captures in the squid trawl fisheries over three observer years

| Species | 2004/05 | | 2005/06 | | 2006/07 | |

2004/05

The majority of fishing effort for squid was in SEC, SOU and SUB while observer coverage is focussed in FMAs SOU and SUB (Table 39). A high rate of seabird captures occurs in both SOU and SUB and the highest rate of marine mammal capture occurs in SUB.

Table 39: Summary of commercial effort, observer effort and protected species captures in the squid trawl fisheries for the period 1 July 2004 – 30 June 2005.

| FMA | Effort days | Observer days | % coverage | No. tows | Seabird captures | Seabirds per 100 tows | Mammal captures | Mammals per 100 tows |

| 6. SUB | | 4 | 3 | 3 | 10 |
| Total | 1 | 5 | 4 | 3 | 13 |

2005/06

As in the previous year, the greatest commercial effort was in SOU, followed by SUB and SEC (Table 44). Over 20% of observer coverage was achieved in SUB with less in SOU (14%). Seabird capture rates were again high in SOU and SUB as well as SEC. Only 11 days were observed in SEC, less than 2% of fishing effort. Marine mammal capture rates were lower than the previous year.

Table 44: Summary of commercial effort, observer effort and protected species captures in the squid trawl fisheries for the period 1 July 2005 – 30 June 2006.

| FMA | Effort days | Observer days | % coverage | No. tows | Seabird captures | Seabirds per 100 tows | Mammal captures | Mammals per 100 tows |
|---------|-------------|---------------|------------|----------|------------------|-----------------------|-----------------|----------------------|

| SUB | | | | 81 | 22 | 2 | | 105 |
| Total | 2 | 1 | 1 | 96 | 42 | 55 | 11 | 208 |

Four fur seals were caught between January and May, one in SEC, one in SUB and two in SOU. New Zealand sea lion captures occurred in SUB with two caught in February and five in March.

2006/07

Higher levels of observer coverage were achieved in SOU and SUB in 2006/07 and an increase in observer days were achieved in SEC, although the number of days remained low (Table 47). Seabird captures were highest per tow in SEC while capture rates in SOU and SUB were reduced compared to previous years.

Table 47: Summary of commercial effort, observer effort and protected species captures in the squid trawl fisheries for the period 1 July 2006 – 30 June 2007.

| FMA | Effort days | Observer days | % coverage | No. tows | Seabird captures | Seabirds per 100 tows | Mammal captures | Mammals per 100 tows |
|---------|-------------|---------------|------------|----------|------------------|-----------------------|-----------------|----------------------|

| 6. SUB | | | 27 | 15 | 7 | | 49 |
| Total | 3 | 8 | 54 | 33 | 31 | 7 | 136 |

Fur seal captures occurred from February to April with five seals caught in SOU and one in SEC. Seven sea lions were caught in SUB from February to March and one in SOU in March.

PELAGIC TRAWL FISHERIES

Jack Mackerel and Barracouta

The highest numbers of common dolphin captures have been recorded in the pelagic trawl fishery including the capture of 17 dolphins by three vessels west of Auckland in November 2004.

Dusky dolphins, fur seals and seabirds have also been recorded caught in this fishery. The majority of observer coverage is from October to December with some coverage from April to July. Vessels can employ several techniques aimed at reducing the likelihood of interacting with dolphins, including not fishing during hours of the day when dolphin interactions are more likely and not setting nets when dolphins are present around the vessel. An industry-led Marine Mammal Operating Procedure is in place which provides guidance on best practice to reduce dolphin bycatch. Seabird and marine mammal captures per observer year are detailed in Tables 50 and 51. Captures by target species are given in Tables 52 to 54.

Table 50: Seabird captures in pelagic fisheries over three observer years

2004/05

Pelagic trawl fishing effort was spread through most FMAs with the majority of effort in CHA, CEW, SEC and AKW (Table 55). In 2004/05, observer coverage was highest in AKW, followed by SOU and CEW. The highest rate of seabird captures reported in SOU while the highest rate of marine mammal captures occurred in AKW.

Table 55: Summary of commercial effort, observer effort and protected species captures in pelagic trawl fisheries for the period 1 July 2004 – 30 June 2005.

| FMA | Effort days | Observer days | % coverage | No. tows | Seabird captures | Seabirds per 100 tows | Mammal captures | Mammals per 100 tows |

2005/06

The numbers of commercial fishing days in 2005/06 were similar to the previous year, but almost twice as many days were observed (Table 59). The highest levels of observer coverage were in SOU and CEW and over 15% of all fishing effort was observed. Seabird captures were again highest in SOU. Unlike 2004/05, marine mammal captures were highest in CHA and no captures were recorded in AKW.

Table 59: Summary of commercial effort, observer effort and protected species captures in pelagic trawl fisheries for the period 1 July 2005 – 30 June 2006.

| Total | 2 | 17 | 1 | 1 | 1 | 22 |

Fewer dolphins were caught in 2005/06 with three animals caught in CHA and one caught in SEC.

2006/07

Compared to 2005/06, similar levels of both commercial and observer effort were reported in 2006/07 (Table 63). Observer coverage of greater than 10% was achieved in five FMAs with over 15% of total commercial effort observed. As in previous years, the highest rate of seabird captures were in SOU and the highest rate of marine mammal captures were in AKW.

Table 63: Summary of commercial effort, observer effort and protected species captures in pelagic trawl fisheries for the period 1 July 2006 – 30 June 2007.

| Total | 23 | 18 | 3 | 76 | 16 | 78 | 60 | 6 | 71 | 20 | 51 | 422 |

All eight seabird captures occurred in SOU in March and April except for one capture in SOE in May. Seven fur seals were caught in 2006/07 throughout the year and across four FMAs. Eight common dolphins were caught; three in AKW in October and five in CHA in April.

DEEP WATER BOTTOM TRAWL FISHERIES

Orange Roughy and Oreo

The majority of observer coverage on vessels targeting orange roughy and oreo species has been in the Subantarctic and Chatham Rise fishery management areas with lesser coverage in other areas. A particular focus of observer coverage in this fishery is to monitor impacts of deepwater trawling on protected corals, particularly on the Chatham Rise. Seabird interactions and behaviour around vessels are also monitored. Mitigation techniques employed in this fishery include offal and discard management and the use of bird scaring devices to mitigate seabird captures. Vessels sometimes trawl known tracks to avoid catching deep sea invertebrates. Coral captures tend to occur when vessels are looking for new fishing grounds or miss known marks. Seabird and marine mammal captures per observer year are detailed in Tables 65.

Table 65. Protected species captures in deep water bottom trawl fisheries over three observer years

2004/05

Deep water trawl effort for orange roughy and oreo species was undertaken through all FMAs except the Kermadecs (Table 66). The majority of observer effort was in SOE, SUB and AKW. The highest number of bird captures were reported from SOE, many of which were live captures. Fur seal captures were reported from SUB.

Table 66: Summary of commercial effort, observer effort and protected species captures in deep water bottom trawl fisheries for the period 1 July 2004 – 30 June 2005.

| FMA | Effort days | Observer days | % coverage | No. tows | Seabird captures | Seabirds per 100 tows | Mammal captures | Mammals per 100 tows |

| 9. AKW | | | | 8 | 4 | | | | | | 9 | 21 |
| Total | 56 | 1 | 4 | 93 | 17 | 10 | 4 | 1 | 19 | 86 | 88 | 379 |

Seabird captures occurred in SOE (four captures), SEC (three captures) and SUB (one capture).

In 2005/06, the greatest estimated weight of coral landed was recorded from AKW (Table 72). This high number is partly explained by one tow that recorded 3000 kg of unidentified

coral. The observer record for that trip confirms that a large quantity of coral was landed and immediately discarded on one tow.

Note that branching structure-forming deepsea stony corals (Order Scleractinia) can form areas of ‘reef’ or ‘thicket’ habitat on the sea floor. Owing to their fragility, these corals can become rubble-like when taken as by-catch in trawl gear. The corals can also become rubble due to natural processes, e.g. as a result of breakup due to the physical weakening of the structure with ageing or possibly disturbance from strong currents. Thus, what is termed “coral rubble” can comprise recently dead and/or long dead coral material. The “coral rubble” sampled on deck often comprises live polyps on the growing tips and branches. The complex physical structure of erect living coral and coral rubble provides habitat for fish and invertebrates (D. Tracey, pers. comm.).

INSHORE FISHERIES

As there is a large amount of inshore fishing effort throughout the EEZ, it is difficult to achieve coverage levels that would enable an estimation of total bycatch in these fisheries. In order to enhance the likelihood of achieving such coverage levels, observer coverage is focussed in specific areas (and sometimes specific seasons) where protected species interactions may be occurring and such coverage is rotated through different areas between years with some success. In addition, observer coverage is aimed at describing the fishing methods employed and identifying whether any protected species interactions are occurring and, if so, how those interactions might be mitigated.

Inshore trawl

The extent to which inshore trawl vessels interact with protected species is extremely poorly known due to minimal historic observer coverage in almost all areas. Observer coverage of the inshore trawl fishery in the Pegasus Bay – Canterbury Bight area in 1997-1998 reported the capture of one Hector's dolphin (Starr and Langley 2000). Prior to observing this fishery, five Hector's dolphins were known to have been caught by trawlers off the east coast of the South Island. Hector's dolphins have also been recorded caught on unobserved inshore trawl vessels operating on the west coast of the South Island in the late 1980s. Since 1997-1998, four dolphin mortalities have been caused by inshore trawlers including three animals caught in one trawling event in April 2006 (Hector's dolphin incident database, Department of Conservation).

Observations aboard inshore trawl vessels began in the 2006/07 observer year with coverage undertaken in AKE to monitor seabird interactions, CHA to monitor Hector's dolphin and seabird interactions and in CEW and AKW to monitor Maui's dolphin interactions. A total of nine vessels were observed during the 2006/07 observer year, during which 106 observer days were achieved.

Monitoring priorities include collecting data on protected species interactions and behaviours and the mitigation and offal management techniques employed aboard inshore trawl vessels.

Protected species captures per observer year are detailed in Table 77.

Table 77. Protected species captures in inshore trawl fisheries from 1 July 2006 to 30 June 2007

| Species | Dead | Alive |
|-------------------------|------|-------|
| Black petrel | 1 | |
| Flesh-footed shearwater | 1 | |
| Seabird - large | 1 | |
| Seabird - small | | 1 |
| White-capped albatross | 6 | |
| Total | 9 | 1 |

From Table 78 it can be seen that over 30 000 inshore trawl fishing days were reported from July 2006 until June 2007 of which only 106 days were observed. Despite minimal observer coverage, seabird captures were reported including warp captures of white-capped albatrosses in CHA and CEE. The black petrel and flesh-footed shearwater were both captured in nets on one trip operating in AKE.

Table 78: Summary of commercial effort, observer effort and protected species captures in inshore trawl fisheries for the period 1 July 2006 – 30 June 2007.

| FMA | Effort days | Observer days | % coverage | Seabirds | Mammals | Reptiles |
|---------|-------------|---------------|------------|----------|---------|----------|
| 1. AKE | 4338 | 39 | 0.9% | 3 | | |

| 3. SEC | 9351 | | 0.0% | | | |
| 4. SOE | 757 | | 0.0% | | | |
| 5. SOU | 3667 | 2 | 0.1% | | | |
| 6. SUB | | | | | | |
| 7. CHA | 8391 | 34 | 0.4% | 4 | | |
| 8. CEW | 1245 | | 0.0% | | | |
| 9. AKW | 1578 | 27 | 1.7% | | | |
| 10. KER | | | | | | |
| Total | 35064 | 106 | 0.3% | 10 | 0 | 0 |

During the 2006/07 observer year, days observed aboard inshore trawl vessels occurred at various times throughout the year and in five different Fisheries Management Areas (Table 79). Few days were observed when considering the total number of fishing days undertaken in these areas (Table 78).

Table 79: Observed days for months and areas where inshore trawl observer coverage was undertaken during the period 1 July 2006 – 30 June 2007.

| FMA | Jul-06 | Aug-06 | Sept-06 | Oct-06 | Nov-06 | Dec-06 | Jan-06 | Feb-07 | Mar-07 | Apr-07 | Total |
|--------|--------|--------|---------|--------|--------|--------|--------|--------|--------|--------|-------|
| 1. AKE | | | | | | | | | 19 | 20 | 39 |
| 2. CEE | 4 | | | | | | | | | | 4 |
| 5. SOU | | | | | | | | 2 | | | 2 |
| 7. CHA | | 6 | | | | | | 18 | 7 | 3 | 34 |

| Total | 4 | 6 | 0 | 14 | 0 | 0 | 0 | 26 | 31 | 25 | 106 |

Protected species interactions during the 2006/07 observer year are summarised in Table 80. It should be noted that observers working in CHA reported warp strikes occurring but were not specifically tasked with undertaking warp strike observations using the MFish protocol.

Table 80: Protected species interactions reported from observed inshore trawl trips from 1 July 2006 – 30 June 2007.

| Date | FMA | Target | Species | Dead / Alive |
|-------------|------------|---------------|-------------------------|---------------------|
| Jul-06 | CEE | TAR | Unidentified albatross | Dead |
| Jul-06 | CEE | TAR | White-capped albatross | Dead |
| Jul-06 | CEE | TAR | White-capped albatross | Dead |
| Apr-07 | AKE | TAR | Unidentified petrel | Alive |
| Apr-07 | AKE | JDO | Black petrel | Dead |

| Mar-07 | CHA | TAR | White-capped albatross | Dead |
| Apr-07 | CHA | TAR | White-capped albatross | Dead |
| Apr-07 | CHA | TAR | White-capped albatross | Dead |

Five of the nine vessels used bird mitigation devices, one of which was required to do so as it is 32 m in length. Two vessels used bird bafflers and on one vessel the observer stated the device did not appear to be effective. Three vessels used streamer lines of varying designs. One vessel, operating in CHA and CEE used a buoyed line from the stern, clipped closely to the warp, as a mitigation device. While the observer considered this device to be effective, warp strikes were recorded from this vessel. Another vessel (18 m in length) attempted to use a tori line while the observer was aboard but found it difficult to operate due to the vessel set-up and lack of familiarity of crew with this gear. The third vessel used a tori line throughout the trip with no operational difficulties.

All nine vessels avoided discharging offal during hauling and three of the nine also avoided discharging during shooting. In the case of the one vessel that incidentally killed four white-capped albatrosses, the observer noted ‘No mitigation measures are in place on this vessel and the one factor that appeared to influence incidental seabird bycatch was discarding of NQBC and offal. Offal discharged during shooting, towing but not hauling.’

Up to 400 white-capped albatrosses were seen attending inshore trawl vessels on the west coast of the South Island, and up to 200 petrels attended vessels in AKE. Hector’s dolphins were seen on three trips, all on the west coast of the South Island.

Inshore bottom longline (ling, blue nose, hapuku & bass, snapper)

Little is known about protected species interactions in inshore bottom longline fisheries due to little or no historic observer coverage. The nature of the fishery, including variability in governance structure, small vessel size and weather dependence, can make placing observers difficult. Observations of inshore bottom longline fisheries began in 2004/05. During the period of the 2004/05 to 2006/07 observer years, bottom longliners targeting snapper were observed separately from those targeting other stocks.

CSP observer coverage in the inshore LIN, BNS, HPB fisheries has been focussed in AKE, CEE, SOE and SOU. Observations in the snapper fishery were undertaken in AKE to monitor interactions with seabirds, particularly black petrels. Through CSP, an advisory officer was placed in both the inshore 'ling' and inshore snapper fisheries to learn about fishing practices and pass on knowledge regarding protected species behaviour and mitigation techniques (Kellian 2004; Johnson 2005). Mitigation includes tori lines, line weighting regimes and using fish oil to deter birds behind vessels (Pierre and Norden 2006).

Ling, blue nose, hapuku and bass

Protected species captures reported from bottom longline vessels (< 46 m in length) targeting ling, blue nose, hapuku and bass per observer year are detailed in Table 81. No captures were reported in 2004/05.

Table 81: Protected species captures in inshore bottom longline fisheries targeting ling, blue nose, hapuku and bass over three observer years

| Species | 2004/05 | | 2005/06 | | 2006/07 | |

2004/05

Over 4000 fishing days were reported from inshore bottom longline vessels in 2004/05 (Table 82). Nine active fishing days were observed through two Fisheries Management Areas with an additional seven days observed out of zone. No protected species captures were reported in 2004/05.

Table 82: Summary of commercial effort, observer effort and protected species captures in LIN, BNS, HPB bottom longline fisheries for the period 1 July 2004 – 30 June 2005.

2005/06

Fewer commercial fishing days were reported from inshore bottom longline vessels in 2005/06 (Table 84) compared to the previous year. Forty days of fishing activity were observed through three Fisheries Management Areas and nine days were observed out of zone. Eleven seabirds were caught in SOE during one trip in January 2006.

Table 84: Summary of commercial effort, observer effort and protected species captures in LIN, BNS, HPB bottom longline fisheries for the period 1 July 2005 – 30 June 2006.

The capture of 10 white-chinned petrels (two released alive) and one Salvin's albatross were all reported from one trip in SOE in January 2006.

2006/07

In 2006/07, 48 active fishing days were observed, which is around 1% of total commercial effort days (Table 86). Almost all observer effort was in AKE where five seabird interactions were reported; all these birds were released alive.

Table 86: Summary of commercial effort, observer effort and protected species captures in LIN, BNS, HPB bottom longline fisheries for the period 1 July 2006 – 30 June 2007.

| Total | 4672 | 48 | 1.0% | 118981 | 5 | 0.04 | 0 | 0 |

Observer coverage in 2006/07 was from August through to June with 43 of the 48 days observed in AKE. Five seabird interactions were reported in December 2006 from one trip – two black petrels were hooked during hauling and released alive while reports of three deck strikes were also made (two black petrels and one white-chinned petrel).

Snapper

The snapper fishery operating in AKE was observed in 2004/05 and 2005/06 to monitor for interactions with seabirds, particularly black petrels. Observer coverage was concentrated over the summer months to coincide with the peak of fishing activity and petrel breeding seasons.

Protected species captures reported from bottom longline vessels targeting snapper per observer year are detailed in Table 87. Three black petrels were caught over two observer years. This fishery was not observed in 2006/07.

Table 87. Protected species captures in snapper bottom longline fisheries over two observer years

| Species | 2004/05 | | 2005/06 | |
|-------------------------|---------|-------|---------|-------|
| | Dead | Alive | Dead | Alive |

| 047 | 1 | | | | 1 |
| Total | 24 | 49 | 28 | 35 | 136 |

Seabird captures occurred in all months where there was effort, with the highest number of interactions reported in March. Nine of 14 captures were released alive. Four flesh-footed shearwaters and one black petrel were incidentally killed.

2005/06

Fewer fishing days were reported from snapper bottom longline fishers in 2005/06 compared to the previous year (Table 90). The majority of effort was again in AKE as was all observer coverage in 2005/06. Twelve seabird interactions were reported, ten of which were released alive.

Table 90: Summary of commercial effort, observer effort and protected species captures in snapper bottom longline fisheries for the period 1 July 2005 – 30 June 2006.

| 008 | | | 1 | | 1 |
| Total | 18 | 12 | 10 | 5 | 45 |

Setnet

The extent to which commercial setnet fishing activities interact with protected species is largely unknown due to very low historic achievement of observer coverage. Despite historic intent to collect observer data, this fishery has been difficult to observe because, as with other inshore fisheries, it encompasses smaller vessels carrying out short trips, less predictable operations and there are practical difficulties notwithstanding the legal requirement to take government fisheries observers. The Pegasus Bay-Canterbury Bight setnet fishery (Statistical Areas 020 and 022) was observed during the 1997-1998 fishing year, during which time eight Hector's dolphins were observed caught in setnets, of which two were released alive (Starr and Langley 2000).

In the 2005/06 fishing year, observations were undertaken in Southland (SOU) and the Nelson / Marlborough region (CHA) to monitor interactions with Hector's dolphins and seabirds. During the 2005/06 fishing year, a small number of fur seals and shags were recorded caught. Setnet fisheries were also observed in the 2006/07 fishing year in Kaikoura (SEC), Nelson (CHA) and in Southland (SOU). Protected species mortalities during 2006/07 included one dusky dolphin, one Hector's dolphin, one fluttering shearwater and two yellow-eyed penguins, all as separate incidents (Table 92).

Table 92. Protected species captures in setnet fisheries over two observer years

| Species | 2005/06 | | 2006/07 | |
|-----------------------|---------|-------|---------|-------|
| | Dead | Alive | Dead | Alive |
| Cape petrels | | | | 3 |
| Dusky dolphin | | | 1 | |
| Fluttering shearwater | | | 1 | |
| Fur seal | 3 | | 1 | |
| Hector's dolphin | | | 1 | |
| Pied shag | 1 | | | |
| Seagull | | | | 1 |
| Shag | | | | 6 |
| Sooty shearwater | | | | 1 |
| Spotted shag | 2 | | | |
| White-chinned petrel | | 1 | | |
| Yellow-eyed penguin | | | 2 | |
| Total | 6 | 1 | 6 | 11 |

Mitigation to avoid the incidental capture of dolphins included avoiding river mouths and murky water, not setting when dolphins were present around the vessel and the use of acoustic alarms (particularly east coast South Island). Catch processing and discarding of waste generally took place outside the periods of setting and hauling so that nets were not in the water when birds were feeding on waste around the vessel. Nets were also cleaned to some extent, providing less of an attractant to foraging seabirds. Some vessels also practiced night setting.

2004/05

While 100 days of setnet observer coverage were planned in 2004/05, no coverage was achieved.

2005/06

Over 20 000 setnet fishing days were reported in 2005/06 of which 83, less than 1%, were observed (Table 93).

Table 93: Summary of commercial effort, observer effort and protected species captures in setnet fisheries for the period 1 July 2005 – 30 June 2006.

Setnet observations were achieved from November to April during which time almost 9% of coverage was achieved across the areas where coverage was undertaken (Table 94). The highest levels of coverage were in Statistical Areas 025 and 027 in Southland and 038 in Nelson. Three shags were incidentally caught in the Nelson region and three fur seals were reported caught in Southland.

2006/07

A greater number of observer days was achieved in 2006/07 compared to the previous year but the percentage of total fishing effort observed remained below 1% (Table 95). However, 10% observer coverage was achieved in SOU. A greater number of seabird captures were reported along with two dolphin captures.

Seabird captures were reported from November to January (Table 97) and included the incidental mortality of two yellow-eyed penguins and one fluttering shearwater. Eleven live seabird captures were also reported. One fur seal was caught in February in SOU. A dusky

dolphin was caught in Kaikoura in November and a Hector's dolphin was caught there in December. The two penguins were caught in nets set in water depths of 51 and 35 m while the Hector's was caught in net set on the bottom in 27 m water depth.

SURFACE LONGLINE FISHERIES

Charter tuna

CSP observer coverage of charter tuna vessels has mostly been in SOU and CHA from March until July, with some coverage in CEE and KER. This fishery has historically had high captures of seabirds (including a variety of albatrosses and petrels), and while captures were lower during the 2004/05 and 2005/06 observer years, high seabird captures were recorded during 2006/07. Fur seals and sea turtles are occasionally caught on hooks or entangled in lines, but are usually released alive after being cut free.

Surface longline vessels are required to use streamer lines and to night set or weight lines in accordance with regulated requirements. Some vessels use brickle curtains and water cannons during hauling to try and reduce the likelihood of seabird captures.

Protected species captures per observer year are detailed in Table 98.

Table 98. Protected species captures in charter surface longline fisheries over three observer years

| Species | 2004/05 | | 2005/06 | | 2006/07 | |
|--------------------------|---------|-------|---------|-------|---------|-------|

| Total | 32 | 43 | 60 | 47 | 182 |

The greatest number of seabird captures occurred in April in SOU (14 captures) and in CHA in May (10 captures). Fur seal captures were reported in CHA from May to June (10 captures) and in SOU in April and May (6 captures). One leatherback turtle was caught and released alive in AKW in May.

2005/06

Fishing effort in 2005/06 was in CEE, CHA and SOU, as was observer effort (Table 101). All fishing effort was observed. Note there are a few discrepancies in FMAs reported by fishers and observers.

Table 101: Summary of commercial effort, observer effort and protected species captures in the charter surface longline fishery for the period 1 July 2005 – 30 June 2006.

2006/07

As in previous years, fishing effort and observer coverage was undertaken in CEE, CHA and SOU but also in AKE and KER (Table 103). Four vessels were operating in the charter tuna fishery in 2006/07 of which two vessels were observed so that 63% of total coverage was achieved. The overall capture rate of seabirds was higher than in previous years.

Table 103: Summary of commercial effort, observer effort and protected species captures in the charter surface longline fishery for the period 1 July 2006 – 30 June 2007.

| FMA | Effort days | Observer days | % coverage | No. hooks | Seabird captures | Seabirds per 1000 hooks | Mammal captures | Mammals per 1000 hooks | Reptiles |

Domestic tuna and swordfish

Historically, there has been difficulty placing observers on smaller domestic tuna vessels and, therefore, further data are required to better assess protected species interactions. Through CSP, an advisory officer was placed in this fishery from April 2003 to June 2004 to learn about fishing practices and to share information on protected species behaviour and mitigation techniques (Hibell 2005). Swordfish has recently been introduced into the quota management system so that observations in 2006/07 include vessels targeting tuna and swordfish. Following the large bycatch event of 58 birds (including 51 albatrosses) during one trip targeting swordfish in November 2006, regulations were introduced by the Ministry of Fisheries in January 2007 requiring all surface longline fishers to provide notice of departure to the Ministry of Fisheries observer programme. This has facilitated observer placement. Vessels must also use streamer lines and set at night or weight lines, in accordance with legal requirements.

Protected species captures per observer year are detailed in Table 106.

Table 106: Protected species captures in domestic surface longline fisheries over three observer years

| Species | 2004/05 | | 2005/06 | | 2006/07 | |

| Total | 3 | 1 | 5 | 3 | 11 | 23 |

2006/07

Fishing effort in 2006/07 was reduced compared to previous years (Table 114). While observer effort was again focussed in the two FMAs with the greatest fishing effort (AKE and CEE), the greatest number of observer days was delivered in KER, coinciding with the introduction of swordfish to the Quota Management System. The level of observer coverage achieved was highest in KER with over 20% of total effort observed. The greatest rate of seabird captures also occurred in KER. Observer coverage of total effort was higher than in previous years but still below 5%.

Table 114: Summary of commercial effort, observer effort and protected species captures in domestic surface longline fisheries for the period 1 July 2006 – 30 June 2007.

| | Effort days | Obs days | % coverage | No. hooks | Seabird captures | Seabirds per 1000 hooks | Mammal captures | Reptiles | Reptiles per 1000 hooks |
|---------|-------------|----------|------------|-----------|------------------|-------------------------|-----------------|----------|-------------------------|
| 1. AKW | 983 | 28 | 2.9% | 32380 | 9 | 0.28 | | | 0.00 |

Seabird captures were recorded in CEE from March to July (Table 116), in AKE from November to December and in KER from October to November. Captures in KER included one large capture event when two leatherback turtles were caught and released alive as well as 58 seabirds, mostly albatrosses, of which 18 were released alive. Fur seals have most frequently been caught in CEE during June or July. In total, four leatherbacks were caught

during the 2006/07 observer year; one in March in CEE and three in KER from September to December.

BOTTOM LONGLINE FISHERY

Deep-sea ling

The deep-sea ling bottom longline fishery is observed to monitor for seabird and marine mammal interactions. Mitigation methods employed include tori lines, integrated weighted line and offal and bait discard management.

During the 2006/07 observer year, the majority of observer coverage was in SOU from August to October with some coverage in CEE and SEC. In previous years, there has been more even coverage, in terms of days, spread between CEE, SOE, SOU and SUB. Observer coverage is generally from May to June and August to October.

Protected species captures per observer year are detailed in Table 117. Only one marine mammal capture was reported.

Table 117. Protected species captures in the deep sea bottom longline fisheries over three observer years

2004/05

During 2004/05, over 600 commercial fishing days were reported by vessels over 46 m in length, using the method of bottom longline. 121 of these days were observed (Table 118). The highest rates of seabird interactions were reported from SOU.

Table 118: Summary of commercial effort, observer effort and protected species captures in the deep water bottom longline fishery for the period 1 July 2004 – 30 June 2005.

| | Effort days | Observer days | % coverage | No. hooks | Seabird captures | Seabirds per 1000 hooks | Mammal captures | Mammals per 1000 hooks | Reptiles |

Discussion

Middle depth trawl fisheries

Hake, hoki, ling and silver warehou

Levels of observer coverage in this fishery are generally around 15% of fishing effort due to priorities of both the Department and the Ministry of Fisheries to monitor various aspects of fishing activity. In most fisheries management areas where commercial fishing activity is undertaken for hake, hoki, ling or silver warehou some level of observer coverage is achieved. However, over 100 commercial fishing days targeting ling were reported in the AKE Fishery Management Area in each year discussed, yet no observer coverage was planned or achieved for this area. As such, no information exists on whether protected species interactions occur in AKE.

Moderate numbers of seabirds and fur seals are reported incidentally caught by vessels using the method of middle depth trawl to target hoki, hake, ling and silver warehou. Captures of seabirds and marine mammals are reported from most areas where there is observer effort. The highest rates of seabird captures were reported from SEC, despite lower observer coverage in that fishery area. Seabird captures were highest in 2005/06 due to several large capture events of sooty shearwaters in nets. Fur seal captures were also up in 2005/06 and while the highest numbers of fur seals were reported caught on the west coast of the South Island, capture rates were higher in other areas. Interactions with both seabirds and fur seals were reduced in 2006/07, mostly due to a reduction in multiple capture events as reported in 2005/06 indicating that individual vessels contributed less to the overall total.

Mitigation devices and practices are currently being investigated for use in this fishery. Research into offal management is currently underway and will hopefully address warp capture interactions in SEC and other areas. Fur seal mitigation devices are being trialled and observer reports of seabird net captures have been investigated to help determine the feasibility of mitigating against net captures during setting and hauling.

Southern blue whiting

The southern blue whiting fishery operates in a discrete space and time and has higher levels of observer coverage than most other trawl fisheries. Of greatest concern in this fishery is increasing numbers of marine mammal captures over the three observer years, particularly NZ sea lions. At present, no mitigation devices or practices are currently in place in this fishery to reduce the likelihood of pinniped interactions, even though interaction rates are higher than in other trawl fisheries where mitigation is employed or under development.

Scampi

The scampi fishery has historically had poor observer coverage, although levels are slowly increasing due to wider interest in gaining observer coverage in this fishery (previously observed solely through CSP). No observer coverage was achieved in SUB in 2004/05, even though this area has the second highest level of commercial fishing effort, but coverage was achieved in SUB during the next two observer years. While moderate levels of coverage have

more recently been achieved in AKE, SOE and SUB, greater levels of observer coverage are desirable in this fishery given the number of seabird captures and occasional NZ sea lion captures.

Despite low coverage, seabird capture rates are generally higher in this fishery compared to other trawl fisheries (except squid). Seabird interactions are most frequently reported in AKE and SUB, where the majority of observer coverage is focused. A variety of seabird mitigation devices are employed by scampi vessels, although many do not meet regulated specifications as they are not required to do so due to vessel length.

Squid

Levels of observer coverage are generally above 25% for squid vessels operating in SOU or SUB due to priorities of both the Department and the Ministry of Fisheries to monitor protected species interactions. High capture rates of seabirds in SEC are of concern considering minimal observer coverage has been achieved in this area. Increased observer coverage is warranted for squid vessels operating in SEC, especially considering the high number of commercial effort days reported relative to other fishery management areas.

Of all trawl fisheries, the squid fishery operating in both SOU and SUB has historically had the high rates of seabird captures. Capture rates decreased over the three observer years examined in this report with reductions in albatross captures most notable.

Vessels operating in this fishery are required to use regulated seabird mitigation devices. Collaborative research between Government and the fishing industry and the development of discharge management measures has led to changes in offal management. (Offal and discard discharge is the greatest cause of warp captures in this fishery). In addition, Net captures continue to be a concern and mitigation options are currently being investigated. Marine mammal captures, particularly NZ sea lions, have fluctuated over the three years. Research into the survivability of sea lions following escape via sea lion exclusion devices is ongoing.

Pelagic trawl fisheries

While commercial effort targeting pelagic fish stocks is undertaken in eight Fisheries Management Areas, observer coverage is generally focussed in FMAs with the greatest levels of commercial effort. Observer effort has varied between FMAs over the three year period examined. In 2004/05, the greatest commercial fishing effort was in CHA but relatively few observer days were achieved there compared to other areas (AKW, CEW, SOU). In 2005/06, reasonable levels of observer coverage were achieved in four FMAs and by the 2006/07 observer year, coverage was spread between eight FMAs.

The most notable protected species interaction in pelagic trawl fisheries is that of multiple captures of common dolphins. During the three observer years discussed in this report, one year reported over 20 dolphin captures while fewer dolphins were caught during the other two years. In general, a few vessels contribute to such capture events in this fishery. Seabird captures were greatest on vessels operating in SOU, particularly in 2005/06 when targeting barracouta. While vessels over 28 m in length are required to use bird mitigation devices, no mitigation devices are currently in place to avoid capturing common dolphins and no research is presently underway.

Deep water trawl fisheries

Around 20% of total fishing effort is generally observed in this fishery, mostly because of Ministry of Fisheries priorities in relation to stock management. In FMAs of particular interest to CSP (SOE and SUB), good levels of coverage have been achieved over the three observer years. During 2005/06 and 2006/07, good levels of observer coverage have also been achieved in AKE, AKW and SOU.

Compared to other trawl fisheries, fewer seabird and marine mammal captures are reported from this fishery. In 2004/05, many of the seabird interactions reported were released alive including 19 instances where birds struck the vessel or landed on the deck.

While fewer seabirds and marine mammals are incidentally caught in this fishery compared to other trawl fisheries, the greatest amount of coral is landed in this fishery. At present, no mitigation practice besides avoidance is known to reduce the likelihood of incidentally 'catching' corals and other invertebrates. Fishing known tracks and the use of seabed mapping technology reduces the likelihood of making contact with the seafloor where corals are present.

It is important to note that observers do not weigh corals but are asked to estimate weight in kilograms, which may lead to over or under-reporting of actual weights. It is difficult to assess the accuracy of records but observers are skilled and experienced in estimating weights at-sea (D. Tracey, pers. comm.).

Inshore fisheries

The development of an inshore observer programme to monitor interactions with protected species is progressing, but there are still difficulties associated with monitoring small setnet, trawl and bottom longline vessels. Ongoing difficulties include the higher cost of placing observers on inshore vessels, access to vessels, the difficulties of vessels accommodating an observer on board and the weather dependence of these fisheries. In addition, conflicting priorities for the small pool of Government observers makes it difficult to meet all monitoring requirements. Information gained in these fisheries to date indicates that interactions with seabirds and marine mammals do occur, but the extent of those interactions is currently unknown. Improving understanding of the range of gears and deployment in inshore fisheries will contribute to the development of mitigation measures.

Inshore trawl

As only nine vessels were observed during the 2006/07 observer year it is difficult to generalise about interactions between inshore trawl vessels and protected species. However, interactions detected demonstrate that inshore trawl fishing presents a risk of protected species bycatch risk. The broader extent of this risk is not known. There was variability between vessels in terms of the types of interactions noted (e.g. warp captures versus net captures) and in terms of offal management and mitigation. Avenues for future research in this fishery include offal management, net capture mitigation and the potential to use mitigation devices to reduce warp strikes.

Inshore bottom longline (ling, bluenose, hapuku and bass)

While commercial effort in this 'fishery' is undertaken throughout the year and in all FMAs except KER and SUB, observer coverage achieved to date is very low. While there is scope for higher levels of observer coverage, many of the difficulties in placing observers in this fishery will need to be overcome including the development of better communication networks with vessel managers and operators, and addressing capacity issues in the observer programme. Avenues for mitigation and protected species research in this fishery includes the development of best practice line-weighting regimes given variable gear types and deployment patterns, safe turtle handling and release practices and offal and discard management practices.

Inshore bottom longline (snapper)

Despite minimal observer coverage in 2004/05, 14 protected species interactions were reported including the incidental mortality of four flesh-footed shearwaters and one black petrel. With even lower coverage in 2005/06, 12 interactions were reported including the mortality of two black petrels. As observer coverage was less than 3% in both years, the extent of interactions in AKE is difficult to determine.

Avenues for mitigation and protected species research in bottom longline fisheries includes the development of best practice line-weighting regimes, safe turtle handling and release practices and offal and discard management practices.

Setnet

Across all setnet fishing effort, low levels of observer coverage have been achieved to date. As observer placement has been focussed over the summer period and only in certain fisheries areas, viewing observer coverage within the time and place it was undertaken gives a better picture of coverage levels. In some areas, such as SOU, good levels of observer coverage were achieved over the summer period. Protected species interactions were reported in three areas where observer coverage was undertaken but, due to the low number of observer days achieved, the extent of interactions across the setnet fishery as a whole cannot be determined.

Surface longline fisheries

Charter

Higher levels of observer coverage are achieved aboard charter tuna vessels than any other fishing fleet due to the small number of vessels operating in this fishery, operator cooperation, and the capacity for vessels to accommodate observers. High levels of seabird captures were reported in 2006/07 despite vessels employing multiple mitigation techniques including tori lines, brickle curtains, water cannons and offal management.

Domestic

Domestic tuna vessels are difficult to observe due to similar restrictions found with other small vessels. Less than 5% observer coverage has been achieved in each of the years reported on. The recently introduced requirement for these vessels to provide notice of departure to the observer programme has facilitated the achievement of observer coverage

recently, and is expected to continue to do so in future years. Despite low levels of coverage, protected species interactions are reported in this fishery including seabirds, marine mammals and marine reptiles. The large capture event of 58 seabirds in the 2006/07 observer year led to cooperation between Government and the industry to develop new mitigation techniques. Under current investigation are safe leads and the use of blue-dyed bait.

Deep sea bottom longline fishery

Between 20 and 30% observer coverage has been achieved in this fishery due to the small number of vessels operating, operator cooperation, and the ability of vessels to accommodate observers. Almost 20% observer coverage was achieved in 2004/05, while almost 30% coverage was achieved in 2005/06 and 2006/07. The increase in coverage levels is partly explained by decreasing fishing effort each year while observer coverage remains around 100 days.

In the years presented in this report, the deep sea bottom longline fishery has a lower rate of seabird captures compared to surface longline fisheries. Seabird interactions have been reported from all areas where observer coverage has been undertaken (except CHA where only one day has been observed). Large capture events occasionally occur in this fishery. In the period covered in this report, a multiple seabird capture event was reported from one trip in 2004/05 in SOU. Mitigation techniques are well developed including tori lines, integrated weighted line and offal management. Few vessels operate in this fishery allowing greater knowledge to be gained of fishing and mitigation practices that may be relevant for application to smaller bottom longline vessels.

Appendix 3

Scientific names of protected species mentioned in this report

| Common name | Scientific name | Common name | Scientific name |
|----------------------------------|---|------------------------------------|-------------------------------------|
| Antipodean albatross | <i>Diomedea antipodensis antipodensis</i> | Leopard seal | <i>Hydruga leptonyx</i> |
| Australasian gannet | <i>Morus serrator</i> | Maui's dolphin | <i>Cephalorhynchus hectori maui</i> |
| Black petrel | <i>Procellaria parkinsoni</i> | New Zealand fur seal | <i>Arctocephalus forsteri</i> |
| Black-bellied storm petrel | <i>Fregatta tropica</i> | New Zealand sea lion | <i>Phocarcots hookeri</i> |
| Bottlenose dolphin | <i>Tursiops truncatus</i> | New Zealand white capped albatross | <i>Thalassarche steadi</i> |
| Broad-billed prion | <i>Pachyptila vittata</i> | Northern giant petrel | <i>Macronectes halli</i> |
| Buller's albatross | <i>Thalassarche bulleri bulleri</i> | Northern royal albatross | <i>Diomedea sanfordi</i> |
| Buller's shearwater | <i>Puffinus bulleri</i> | Pacific albatross | <i>Thalassarche bulleri platei</i> |
| Campbell albatross | <i>Thalassarche impavida</i> | Pied shag | <i>Phalacrocorax varius</i> |
| Cape petrel | <i>Daption capense</i> | Pilot whale | <i>Globicephala melas</i> |
| Chatham Island albatross | <i>Thalassarche eremita</i> | Salvin's albatross | <i>Thalassarche salvini</i> |
| Common diving petrel | <i>Pelecanoides urinatrix</i> | Shy albatross | <i>Thalassarche cauta</i> |
| Common dolphin | <i>Delphinus delphis</i> | Snares Cape petrel | <i>Daption capense australe</i> |
| Dusky dolphin | <i>Lagenorhynchus obscurus</i> | Sooty shearwater | <i>Puffinus griseus</i> |
| Fairy prion | <i>Pachyptila turtur</i> | Southern black-browed albatross | <i>Thalassarche melanophris</i> |
| Flesh-footed shearwater | <i>Puffinus carneipes</i> | Southern giant petrel | <i>Macronectes giganteus</i> |
| Fluttering shearwater | <i>Puffinus gavia</i> | Southern royal albatross | <i>Diomedea epomophora</i> |
| Gibson's albatross | <i>Diomedea antipodensis gibsoni</i> | Spotted shag | <i>Phalacrocorax punctatus</i> |
| Green turtle | <i>Chelonia mydas</i> | Wandering albatross (Unidentified) | <i>Diomedea exulans spp.</i> |
| Grey petrel | <i>Procellaria cinerea</i> | Westland petrel | <i>Procellaria westlandica</i> |
| Grey-backed storm petrel | <i>Garrodia nereis</i> | White-chinned petrel | <i>Procellaria aequinoctialis</i> |
| Grey-faced petrel (Great winged) | <i>Pterodroma macroptera</i> | White-faced storm petrel | <i>Pelagodroma marina</i> |
| Hector's dolphin | <i>Cephalorhynchus hectori</i> | White-headed petrel | <i>Pterodroma lessonii</i> |
| Leatherback turtle | <i>Dermochelys coriacea</i> | Yellow-eyed penguin | <i>Megadytes antipodes</i> |
