

Choose appropriate offset currency

1. In some instances, several complementary currencies may need to be used; for example, Stream Ecological Valuation (SEV) for stream impacts, iconic species for a particular species and condition area to assess the impacts on the remainder of biodiversity. More information in [Currencies and accounting systems](#)
2. Improvement rates due to management actions to achieve a no net loss biodiversity offset. In some instances, trend data from management are available, but trend and trajectory is mostly unknown or uncertain. In such cases, low (conservative) improvement rates should be used.
3. Biodiversity offsets require explicit calculation of losses and gains (see [Currencies and accounting systems](#))
